

DMS

(Digital Messaging Service)

Emergency alerts direct to your mobile phone

DMS is a mass notification system that can send text, email, WhatsApp, voice messages or Fireco InSite App notifications to users who are subscribed to the service. DMS is ideal for Building Management Systems e.g. fire alarms.

Benefits

Mass notification system, can connect unlimited users

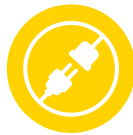

Cloud-based system means range is unlimited

No need for expensive pagers or IT system integration

Create your own alerts in a cloud-based, self-managed web app

Integrates into your existing fire system

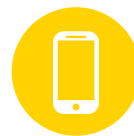

Comply with the Equality Act by notifying deaf users

Software driven inputs and relay inputs

REST API Integration

Use your own device, no apps to install

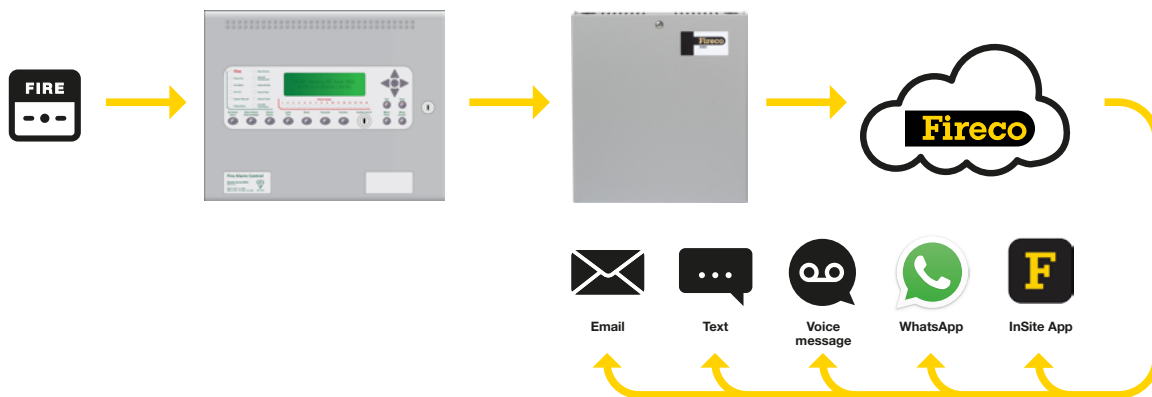

See how DMS works by texting 'WEBDEMO' to 07480 486966

DMS Usage Scenarios

1

Scenario 1

The call point has been pressed and the fire alarm panel is activated. DMS is triggered and sends an evacuation alert to subscribers.

2

Scenario 2

DMS is connected to another internet-based system. When the other system carries out a particular action, subscribers will be alerted by DMS.

3

Scenario 3

The panic button is pushed and DMS is triggered. This sends an alert to the security team who then assess the situation. Other subscribers receive a delayed alert telling them to evacuate the building.
